Drainage Assessment

“The Ridge at Riverwoods” – Administration Wing

Tax Map 80, Lot 18

6 White Oak Drive, Exeter, NH

Altus Project #5056

Revised per Town Review, April 3, 2020

RiverWoods at Exeter is proposing to construct a 3,378 sf building addition and associated improvements on its previously developed 47.14-acre campus located off of Kingston Road (NH 111). Originally permitted in 2003, the existing “Ridge” Continuing Care Retirement Community encompasses over 100 elderly housing dwelling units, a supportive care unit and various maintenance functions spread over several buildings together with associated utility structures, accessways and parking areas. The remainder of the site is comprised of wooded upland and some sections of freshwater wetland, none of which will be impacted by the project. Within the vicinity of the proposed building addition, stormwater runoff is currently directed to a closed drainage system comprised of catch basins and drain manholes tributary to an existing treatment swale designed for the sites original NHDES Alteration of Terrain Permit.

Together with the building additions, the project entails of the demolition of an existing storage building, reconfiguration of existing sidewalks and paved areas and the construction of an outdoor patio area, which taken together result in a net 2,370 sf increase in impervious surface. In order to mitigate this, the existing drainage system will be retrofitted to include several new area drains and a small underground detention facility that reduces the peak rate of runoff from the existing conditions which in turn maintains the effectiveness of the existing treatment swale. The project contemplates a total of only 9,900 sf of land disturbance all of which will be within previously developed areas of the site.

For the purposes of this analysis, only stormwater facilities in the immediate vicinity of the project needed to be evaluated. Currently, the affected area ultimately drains to a catch basin located in a parking area. Identified as Point of Analysis (POA) #100, this structure collects runoff from 1.22 acres of area as shown on the attached Pre- and Post-Development Drainage Area Plans.

The drainage study was completed using the USDA SCS TR-20 Method within the HydroCAD Stormwater Modeling System. Reservoir routing was performed with the Dynamic Storage Indication method with automated calculation of tailwater conditions. A Type III 24-hour rainfall distribution was utilized in analyzing the data for the 2, 10, 25 and 50 year - 24-hour storm events using rainfall data provided by the Northeast Regional Climate Center (NRCC). All rainfall amount have been increased by 15%. Based on site conditions observed during construction of the campus, in situ soils were modeled as Hydrologic Soil Group (HSG) C.

(this page left intentionally blank)

Drainage Analysis

A complete summary of the drainage model is included later in this report. The following table compares pre- and post-development peak rates of runoff for all analyzed storm events:

Stormwater Modeling Summary
Peak Rate (Q) in Cubic Feet per Second (cfs) for Type III 24-Hour Storm Events

Storm Event: Rainfall:	2-Year Storm (3.67 inches)	10-Year Storm (5.62 inches)	25-Year Storm (7.14 inches)	50-Year Storm (8.58 inches)
POA#100				
Existing Catch Basin				
Pre	1.57	2.68	3.55	4.37
Post	1.55	2.50	3.25	4.32
Net Change	-0.02	-0.18	-0.30	-0.05

As the above table demonstrates, the proposed peak rates of runoff will be decreased from the existing conditions of the site at the analysis point for all analyzed storm events.

Groundwater Recharge Calculations

(this page left intentionally blank)

Groundwater Recharge Volume (GRV) Calculation

	ac	Area of HSG A soil that was replaced by impervious cover	0.40"
	ac	Area of HSG B soil that was replaced by impervious cover	0.25"
0.05	ac	Area of HSG C soil that was replaced by impervious cover	0.10"
	ac	Area of HSG D soil or impervious cover that was replaced by impervious cover	0.0"
0.10 inches		Rd = weighted groundwater recharge depth	
0.0054 ac-in		GRV = AI * Rd	
20 cf		GRV conversion (ac-in x 43,560 sf/ac x 1ft/12")	

Provide calculations below showing that the project meets the groundwater recharge requirements (Env-Wq 1507.04):

Proposed SMG has 47 cf of storage below the invert of the lowest outlet.

Stormwater Operations & Maintenance

(this page left intentionally blank)

STORMWATER INSPECTION AND MAINTENANCE MANUAL

6 White Oak Drive Assessor's Map 80 Lot 18

OWNER:
RiverWoods at Exeter
5 White Oak Drive
Exeter, NH 03833

Proper inspection, maintenance, and repair are key elements in maintaining a successful stormwater management program on a developed property. Routine inspections ensure permit compliance and reduce the potential for deterioration of infrastructure or reduced water quality. The following responsible parties shall be in charge of managing the stormwater facilities:

RESPONSIBLE PARTIES:

Owner: _____	<i>Deb Riddell</i>	<i>RiverWoods at Exeter</i>	<i>(603) 658-3002</i>
	Name	Company	Phone

Inspection: _____		
	Name	Company
		Phone

Maintenance: _____		
	Name	Company
		Phone

NOTE: Inspection and maintenance responsibilities transfer to future property owners.

Owner shall submit annual inspection reports to the Town of Exeter Building Inspector by September 1.

CATCH BASINS

Function – Catch basins collect stormwater, primarily from paved surfaces and roofs. Stormwater from paved areas often contains sediment and contaminants. Catch basin sums serve to trap sediment, trace metals, nutrients and debris. Hooded catch basins trap hydrocarbons and floating debris.

Maintenance

- Remove leaves and debris from structure grates on an as-needed basis.
- Sumps shall be inspected on an annual basis and cleaned with a vacuum truck when sediment is more than half the depth of the sump. Catch basin debris shall be disposed of at a solid waste disposal facility.

STORMWATER MANAGEMENT GALLERY

Function – Stormwater Management Galleries (SMG) are subsurface stormwater storage chambers surrounded by open graded stone. SMGs provide several important stormwater functions including pre-treatment in “isolation rows” and detention of stormwater to attenuate peak rates of runoff.

Maintenance:

- Inspect Isolation Row for built-up sediment and debris annually. Sediment and debris accumulation in excess of 3” shall be removed.
- Sediment removal shall be done with a JetVac and vacuum truck. JetVac shall have a fixed floor rear-facing cleaning nozzle with a spread of 45 inches or more. JetVac nozzle shall be propelled down the full length of the isolation row and retrieved towards the vacuum. The process shall be repeated until the backflush water is clean.

LANDSCAPED AREAS - FERTILIZER MANAGEMENT

Function – Fertilizer management involves controlling the rate, timing and method of fertilizer application so that the nutrients are taken up by the plants thereby reducing the chance of polluting the surface and ground waters. Fertilizer management can be effective in reducing the amounts of phosphorus and nitrogen in runoff from landscaped areas, particularly lawns.

Maintenance

- Have the soil tested by your landscaper or local Soil Conservation Service for nutrient requirements and follow the recommendations.
- Do not apply fertilizer to frozen ground.
- Clean up any fertilizer spills.
- Do not allow fertilizer to be broadcast into water bodies.
- When fertilizing a lawn, water thoroughly, but do not create a situation where water runs off the surface of the lawn.

LANDSCAPED AREAS - LITTER CONTROL

Function – Landscaped areas tend to filter debris and contaminates that may block drainage systems and pollute the surface and ground waters.

Maintenance

- Litter Control and lawn maintenance involves removing litter such as trash, leaves, lawn clippings, pet wastes, oil and chemicals from streets, parking lots, and lawns before materials are transported into surface waters.
- Litter control shall be implemented as part of the grounds maintenance program.

GENERAL CLEAN UP

Upon completion of the project, the contractor shall remove all temporary stormwater structures (i.e., temporary stone check dams, silt fence, temporary diversion swales, catch basin inlet basket, etc.). Any sediment deposits remaining in place after the silt fence or filter barrier is no longer required shall be dressed to conform to the existing grade, prepared, and seeded. Remove any sediment in catch basins and clean drain pipes that may have accumulated during construction.

Once in operation, all paved areas of the site should be swept at least once annually, preferably at the end of winter prior to significant spring rains.

APPENDIX

- A. Stormwater System Operations and Maintenance Report
- B. Site Plan

STORM WATER SYSTEM OPERATION AND MAINTENANCE REPORT

General Information		
Project Name	“The Ridge” Administration Wing	
Owner	RiverWoods at Exeter	
Inspector’s Name(s)		
Inspector’s Contact Information
